Business & Functional Requirements Document

Submission deadline	Monday, 31 October 2026	Final presentation	Friday, 27 November 2026

Write this as a business manager, not a software engineer.

It should answer four questions:

what business result the application must deliver, how the work is done today and how it will be done with the app, what the app must do for each user, and how your team will get it built, tested and live by 27 November. The AI app-builder will handle the code; the clarity of this document decides the quality of what it builds. Maximum five pages, plus an appendix for diagrams. Replace every grey prompt with your own words and submit as PDF named **S<Section>_G<Group>_BRD.pdf**.

A TEAM AND PROJECT DETAILS

Section	4	Group no.	5
Group name	TCS	Team lead (email)	avik.dm284018@greatlakes.edu.in jasmeen.dm284027@greatlakes.edu.in
Application name	KinCare		
Changes since Topic Brief	Faculty flagged an overlap with Group 1 (WellNest), which also offered verified home help for elderly parents of children living elsewhere and quoted the same population figures. Agreed split: KinCare keeps verified caregivers and proof of each visit; WellNest drops house help to focus on health-matched meals and fitness. We have therefore removed meal delivery and physiotherapy from our add-on list, and replaced the UNFPA population figures with care-need and market evidence (LASI 2017-18, ResearchAndMarkets). Users, the three core capabilities and the build approach are unchanged.		

1 BUSINESS REQUIREMENTS *Why the business needs this application.*

Business problem	Adult children living away from ageing parents arrange home attendants through agencies, referrals and phone calls, with no verification, no record of what was delivered and no warning when a caregiver fails to turn up. At ₹900–2,000 a day (agency rates, our CPSAT case analysis), a family spends ₹27,000–60,000 a month on care it cannot see. The need is large: 23.8% of Indians aged 60+ have difficulty with at least one basic daily activity and 48% with activities such as shopping or managing medicines (LASI 2017-18, IIPS). Our survey of 26 batchmates whose parents live in another city (October 2026) found that 9 of the 14 families who had a problem with a helper heard about it only when the parent or a neighbour called, and 8 of 14 waited 3 days or more for a replacement or never got one.
Business objectives	**1.** Alert the family to every caregiver no-show within 30 minutes of shift start, within 6 months of launch in Chennai (today: hours, usually when the parent or a neighbour calls). **2.** Place a verified replacement on site within 4 hours for at least 90% of no-shows within 6 months (today: the family arranges cover itself, often over a day or more). **3.** Keep at least 60% of families booking beyond their first 14-day block within 12 months, showing families stay on the platform instead of paying caregivers directly.
Who pays, and why	The adult child pays: a monthly membership of ₹1,500–3,000 (verification, coordinator, alerts and backup cover) plus a 18–25% service fee built into each caregiver shift (CPSAT case unit economics). Compared with paying an agency or attendant in cash, the family gets a verified caregiver, a record of every visit and guaranteed backup, which it cannot arrange itself from another city. India's home healthcare market is projected to reach USD 36.1 billion by 2030, growing about 19% a year (ResearchAndMarkets, 2022).

Business outcomes and success measures *How you will prove the app made a difference. 3–4 rows.*

Business outcome	Measure (KPI)	Today (baseline)	Target	How we will measure it
Families know quickly when care fails	Minutes from missed shift start to family alert	Hours: 13 of 15 families found out 30+ min later, 8 of 15 after 2+ hours (survey Q7)	Under 30 min, within 6 months	App alert log: shift start time vs alert time
Care continues when a caregiver drops out	% of no-shows covered by a replacement within 4 hours	Not tracked: only 1 of 14 got a replacement the same day; 8 of 14 waited 3+ days or never got one (survey Q8)	90% within 6 months	Replacement requests: time opened vs time filled
Families can see that care was delivered	% of booked visits with check-in, photo and task log	0%: cash payment, no record	95% of visits	Visit records vs booked shifts

Business outcome	Measure (KPI)	Today (baseline)	Target	How we will measure it
Families stay instead of going direct	% of families renewing after the first 14-day block	No baseline (new service)	60% within 12 months	Bookings table: renewals per family

2 STAKEHOLDERS AND ACCESS *Everyone affected by the app, and what each is allowed to do in it.*

Stakeholder	Role in the business process	What they need from the app	Access level	Approves / signs off
Adult child (family account holder)	Books and pays for care from another city; decides on replacements	Verified caregivers to choose from; daily proof of each visit; instant alerts	Full user	Yes: own bookings, renewals and consent for the parent
Elderly parent	Receives care at home	To know who is coming today; one tap to raise SOS	View only, plus SOS button	No: consent recorded by the child
Caregiver	Delivers the 12- or 24-hour shift	Today's shift, address and tasks; quick check-in and task log	Full user (own shifts only)	No
Care coordinator	Verifies caregivers and handles no-shows and SOS	An alert queue and a list of available verified caregivers	Manager	Yes: caregiver verification and replacements
KinCare Care Operations head	Owns service quality, pricing and user accounts	KPI view: alert times, replacements, renewals	Administrator	Yes: pricing and caregiver onboarding policy

Access levels: No access (affected but does not use the app) · View only · Full user (uses the main features for their own records) · Manager (sees and approves others' records) · Administrator (manages users and settings).

3 BUSINESS PROCESS DEFINITION *How the work happens today, and how it will happen with the app.*

Current process (As-Is) *4–7 steps. Mark where time, money or quality is lost.*

#	Who	What happens today	Pain point (delay, cost, error, risk)
1	Adult child	Asks relatives, neighbours or a local agency for an attendant, over several calls	Takes days; no way to check the person's background
2	Agency or attendant	Sends whoever is available; family pays in cash or by transfer	No verification or receipt; ₹27,000–60,000 a month with no record
3	Attendant	Arrives, or does not; nothing records time, tasks or readings	Child cannot see whether care happened; missed medicines go unnoticed
4	Parent or neighbour	Calls the child when something goes wrong	No-show or fall discovered hours later
5	Adult child	Phones the agency for a replacement, often from another city	Gap in care of a day or more; child loses work time

Future process with the app (To-Be) *Same process, redesigned. Show which steps the app removes, speeds up or automates.*

#	Who	What happens with the app	Business improvement
1	Coordinator and app	Coordinator marks ID, police check and training; only fully verified caregivers appear in search	Background checking moved from the family to KinCare
2	Adult child	Adds the parent's profile and consent, then books a verified caregiver in the parent's pin code for a 14-day block	Days of calls become a 3-minute booking
3	Caregiver	Checks in with location and photo, ticks tasks and records BP and sugar; the visit appears on the child's timeline	Every visit recorded; payment tied to a visit record
4	App	If there is no check-in 30 minutes after shift start, or the elder taps SOS, alerts the child and the coordinator	Failure known in 30 minutes, not hours (automated)
5	Coordinator	Assigns a replacement from nearby verified caregivers; the child sees the change	Backup within 4 hours with no calls by the child

Process diagram	See Appendix A: swim-lane diagram with lanes for Family, Elder, Caregiver, KinCare app and Coordinator, and decision points "All 3 checks complete?", "Checked in within 30 min?" and "Taps SOS?".

4 FUNCTIONAL REQUIREMENTS *What the app must do, in plain business language. 6–10 requirements.*

ID	The app must allow [user] to [do something]	Process step	Priority	We will know it works when...
FR1	The app must allow the adult child to create a parent profile (name, age, address, pin code, care needs, emergency contact) and record consent on the parent's behalf.	To-Be 2	Must	The profile cannot be saved without the consent box ticked, and saving takes under 2 minutes.
FR2	The app must allow the adult child to browse verified caregivers in the parent's pin code and book a 12- or 24-hour shift for a 14-day block.	To-Be 2	Must	A booking with mock checkout is done in under 3 minutes and each caregiver's verification badges show before confirming.
FR3	The app must allow the caregiver to check in and out with location and a photo, tick tasks and enter BP and sugar readings.	To-Be 3	Must	Check-in takes under 30 seconds and the entry appears on the child's timeline within 1 minute.
FR4	The app must allow the adult child to see a daily timeline of each visit: times, photo, tasks done and readings.	To-Be 3	Must	All of today's entries show in time order and the page loads on a phone in under 3 seconds.
FR5	The app must alert the adult child and the coordinator when there is no check-in 30 minutes after shift start, or when the elder taps SOS.	To-Be 4	Must	A test shift with no check-in alerts both at minute 30; an SOS tap alerts both within 1 minute.
FR6	The app must allow the coordinator to see open alerts and assign a replacement caregiver.	To-Be 5	Must	A replacement is assigned in under 2 minutes and the child's booking shows the new caregiver.
FR7	The app must allow the coordinator to add a caregiver and mark ID, police check and training as complete.	To-Be 1	Must	A caregiver missing any check does not appear in the family's search.
FR8	The app must allow the adult child to rate the caregiver and renew or end the booking at the end of a block.	To-Be 2	Nice	A rating is saved and renewal creates a new 14-day booking with the same caregiver.
FR9	The app must allow the Care Operations head to see the four KPIs in section 1 on one screen.	To-Be 4–5	Nice	The screen shows average alert time, replacement rate, visit-record rate and renewals from test data.

Priority: Must = the app is useless without it and it will be built by 13 November. Nice = only if time allows.

Business rules *The policies the app must enforce, e.g. limits, approvals, eligibility, pricing, deadlines.*

BR1	A booking is a minimum 14-day block of 12- or 24-hour shifts at one address.
BR2	A caregiver is shown to families only after a coordinator has marked all three checks complete: ID, police verification and training.
BR3	If there is no check-in within 30 minutes of shift start, the shift is marked missed, the family and coordinator are alerted and a replacement request opens, to be filled within 4 hours.
BR4	Health readings are visible only to the family account holder, the coordinator and the caregiver on that shift; a caregiver sees an address only for a current shift.
BR5	If a replacement caregiver also fails to check in within 30 minutes, the alert escalates to the Care Operations head.

Out of scope	Real payments (mock checkout only); add-on services such as medicine and grocery delivery, shown as "coming soon" only; meal plans and physiotherapy (dropped: Group 1's scope); hospital and ambulance integration; real ID or police-check lookups (marked by hand); languages other than English; Android or iPhone store apps (mobile web only); wearables; caregiver payroll.

5 USER FLOW *The path each type of user takes through the app, screen by screen.*

User flow diagram	See Appendix B: one flow each for Family, Caregiver, Elder and Coordinator, with arrows labelled by user action.
Flow in words	**Family:** Sign in → Home (parent card, today's visit status) → taps Book care → Caregiver list (pin code, verified badges) → picks caregiver, shift and start date → Mock checkout → Booking confirmed → taps Timeline → sees check-ins, photos, tasks and readings → leaves. **Caregiver:** Sign in → Today's shift (parent, address, tasks) → taps Check in (location and photo) → ticks tasks, enters BP and sugar → taps Check out → leaves. **Elder:** Opens elder screen → sees today's caregiver name and photo → taps SOS if needed → sees "Your family has been told". **Coordinator:** Sign in → Alert queue → opens missed shift → picks an available verified caregiver → taps Assign → family notified.

6 HOW IT WILL BE BUILT *Decisions only. The AI app-builder does the technical work.*

AI app-builder	☐ Lovable ☐ Bolt ☐ Replit ☐ v0 ☒ Other: Claude Code
Where the data is kept	☐ Builder's built-in database ☒ Supabase ☐ Firebase ☐ Google Sheets ☐ No data saved
How users log in	☐ No login ☒ Email & password (Supabase login) ☐ Google sign-in ☐ Phone OTP
Outside services used	☐ None ☐ Maps ☒ WhatsApp / SMS link ☐ Payments (test) ☐ AI feature ☒ Other: phone location at check-in
Where it will go live	☐ Builder's Publish link ☒ Vercel ☐ Netlify ☐ Other: _____
Application structure	Users (Family, Elder, Caregiver, Coordinator) → one mobile web app whose screens depend on the user's role → app logic (booking rules, check-in, 30-minute no-show check, SOS alerts, replacement) → Supabase (login, database, check-in photos). The phone's browser supplies location at check-in; a WhatsApp link lets the family or coordinator contact the caregiver. No existing business system is connected: payments, ID and police checks and service partners are simulated. Diagram in Appendix C.

7 DATA AND PRIVACY: FIRST VIEW

Personal data collected	**Family:** name, phone, email, for login and alerts; seen by the family and coordinator. **Parent:** name, age, address and pin code, to match and send a caregiver; care needs and BP and sugar readings, so the caregiver follows the care plan and the family sees it was done. Health data is sensitive under the DPDP Act 2023, so it is collected only after the family records consent and is seen only by the family, the coordinator and the caregiver on shift. **Caregiver:** name, phone, photo and check status (yes/no), so families know who is coming; we do not store copies of ID documents or Aadhaar numbers. **Check-in location and photo:** proof the visit happened, saved with that visit only; no tracking outside the shift. **Not collected:** card or bank details (mock checkout), continuous location. **Deletion:** when a family closes its account, the parent's profile, readings and photos are deleted. All demo data is invented sample data.

8 MILESTONE PLAN *Fixed deadlines. Fill in what you will deliver and who leads each milestone.*

Milestone	Deadline	What we will deliver	Lead(s)
1. Ideation	Completed	Topic Brief submitted; faculty feedback on overlap with Group 1 addressed (see Changes).	*Ameen Zehra*
2. Requirements	Mon, 31 Oct 2026	This document, with survey results, To-Be swim-lane and user flows (Appendix A–C), and a clickable prototype (link in section 10).	*Ameen; Prateek, Gautam; Shreshtha, Poojasree, Krista*
3. Development	Fri, 13 Nov 2026	Working app covering FR1–FR7, built in Claude Code on Supabase; prompt history saved in a shared document.	*Avik, Jasmeen; Yashraj, Neha, Rohan, Swayam*
4. Testing	Fri, 20 Nov 2026	FR1–FR7 checked against their tests; at least 5 real users complete a booking and view a timeline; issues fixed.	*Shreshtha, Poojasree, Krista; Soham, Ved*
5. Deployment	Tue, 24 Nov 2026	Live on a Vercel link that works on Android and iPhone browsers, loaded with sample data: 10 caregivers and 3 families in Chennai and Kolkata.	*Yashraj, Neha, Rohan, Swayam*

Milestone	Deadline	What we will deliver	Lead(s)
6. Final submission	Fri, 27 Nov 2026	Live demo of one family's journey including a missed-shift alert and replacement; KPI results from testing; lessons learnt.	*Ameen; Poojashree, Gautam; Avik*

Testing approach	**Team:** each requirement is tested by a member who did not build it; the Security & DPDP leads check that each role sees only what BR4 allows. **Real users:** at least 5 batchmates whose parents live in another city act as families; two members act as caregivers and one as coordinator; where possible 1–2 parents try the elder screen. **Devices:** at least two Android phones and one iPhone, in Chrome and Safari. **Ready to go live:** all seven Must requirements pass their test, nothing blocks booking, check-in or alerts, and at least 4 of 5 users complete a booking without help.

9 ASSUMPTIONS AND RISKS

Key business assumptions	**1.** Families will pay ₹1,500–3,000 a month on top of care for verification, visit proof and backup. Survey Q11: 21 of 26 said yes and 5 maybe, none said no; this is stated intent from batchmates, so we will retest with real families. **2.** Families value proof of care and backup above the lowest price. Survey Q10: 'verified caregiver' ranked first overall, but 10 of 26 kept the listed order, and without them price ties with verification; we will test this in user testing. **3.** Caregivers will check in on a smartphone at every visit if pay is tied to the visit record. Check: in testing, and by speaking to 2–3 attendants or agencies before launch. **4.** Parents will accept a caregiver checking in with photo and location. Survey Q12: 23 of 26 said yes or probably, 1 said no.
Top 3 risks	**1. Leakage:** family and caregiver deal directly once trust builds. Response: backup cover and the visit record work only inside the app, and the booking sits with KinCare, not the caregiver. **2. Free-tier limits** (Supabase storage for check-in photos, Vercel usage). Response: compress photos, keep demo data small, use one shared project account. **3. Team availability** during midterms and placements. Response: freeze Must features by 6 November and keep at least two people familiar with the build and prompt history.
Question for faculty	For the live demo, may we shorten the 30-minute no-show timer (for example to 2 minutes) and use sample caregivers rather than real ones?

10 EVIDENCE OF TEAM WORK AND AI USE

Links (view access)	**Miro board:** https://miro.com/app/board/uXjVEVq8MV0=/ **Survey form:** https://docs.google.com/forms/d/e/1FAIpQLSfL7IpAJBtR2_jpDM3wIzLbIvoq4BMct3nWxLHjK0hU4aZeNA/viewform **Survey responses:** https://docs.google.com/spreadsheets/d/1I5HbSQ8dnFrBQ5I6cAcwzwUcahWjgoOf58N6AKXP8zU/edit?usp=sharing **Prompt history:** https://docs.google.com/document/d/1ySzLqBMuHST5iXCaglxVgRV9EsnRV17kO3Lvo-P7MFk/edit?usp=sharing **Task board:** https://docs.google.com/spreadsheets/d/18yz86sljb-SSlx74x1CfxL4fAt9JjVUOMPo84TI7I_M/edit?usp=sharing **Clickable prototype:** https://claude.ai/artifact/WXfXGWK7J7Edd1CLtoZute
How AI was used	Claude (Anthropic) helped find published sources (LASI 2017-18, ResearchAndMarkets), draft the survey questions and appendix diagrams, and build the clickable HTML prototype. Claude Code will build the app from FR1–FR7. The team chose the name KinCare over the AI's suggestions, added the add-on services idea, applied the faculty split with Group 1, made the build decisions (Claude Code, Supabase, Vercel), ran the survey, and added BR5 and the data-deletion rule from team notes on the Miro board.
Who did what	*Requirements & process: Ameen, Prateek, Gautam Design & user flow: Shreshtha, Poojasree, Krista Build (prompts): Avik, Jasmeen, Yashraj, Neha, Rohan, Swayam Testing: Soham, Ved, Shreshtha Presentation: Ameen, Avik, Poojashree, Gautam*

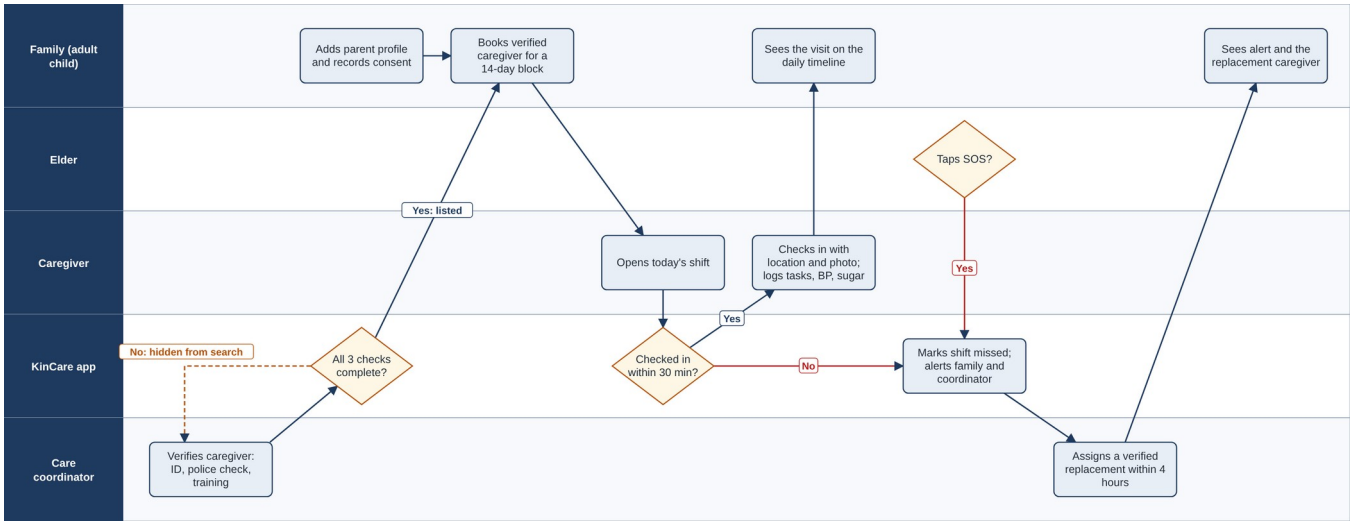

☑ We confirm that this document reflects our team's own business analysis and decisions, that all members contributed, and that we can explain every part of it.

FOR FACULTY USE

Decision	☐ Approved to build ☐ Approved with changes ☐ Revise and resubmit
Comments	

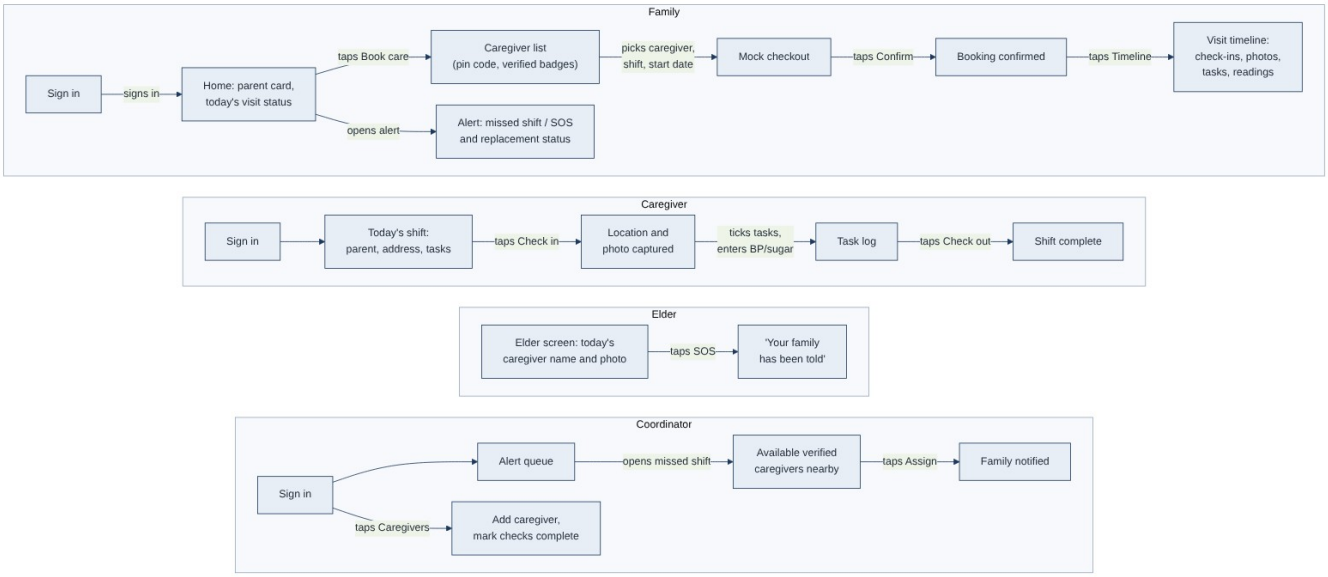

APPENDIX A TO-BE PROCESS: SWIM-LANE DIAGRAM

Referenced in section 3. One lane per stakeholder; diamonds are decision points; red lines are the failure path.

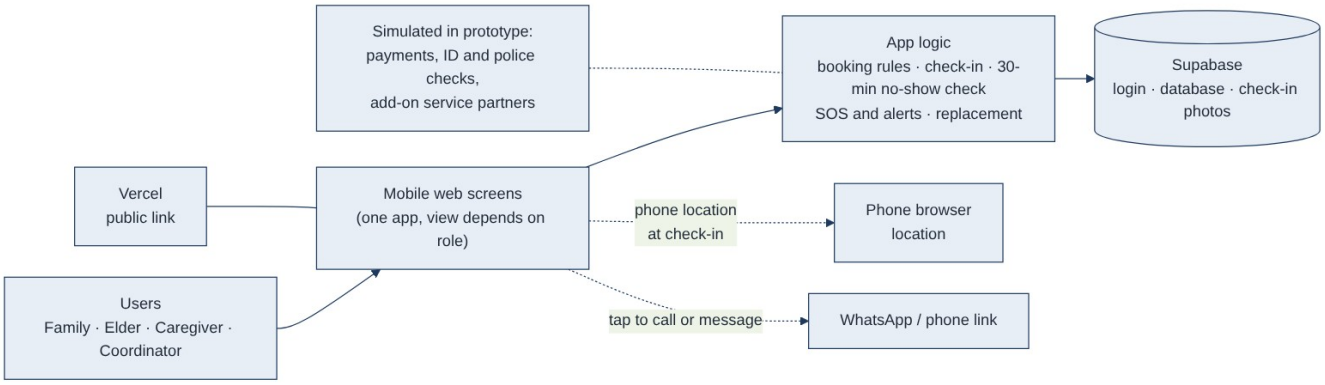

APPENDIX B USER FLOWS, ONE PER USER TYPE

Referenced in section 5. One box per screen; arrows are labelled with what the user does.

APPENDIX C APPLICATION STRUCTURE

Referenced in section 6. Dotted lines are outside services or parts simulated in the prototype.

APPENDIX D FAMILY SURVEY: QUESTIONS AND RESULTS

Google Form sent to PGDM 2026–28 batchmates whose parents or grandparents live in another city or country. Results feed the baselines in section 1 and the assumptions in section 9.

Responses: 34 responses collected 25–26 October 2026; 26 had parents or grandparents in another city and completed the survey. Link to responses in section 10.

Q1. Do your parents or grandparents live in a different city or country from you? *Yes / No (No ends the survey)*

Q2. How old is the oldest of them? *Under 60 / 60–69 / 70–79 / 80+*

Q3. Do they have, or have they had in the last 2 years, a paid attendant, nurse or helper at home? *Yes, now / Yes, in the past / No, but we have considered it / No*

Q4. How did you find that person? *Agency / Relatives or neighbours / Hospital / Online platform / Other*

Q5. Was the person's background checked (ID, police verification)? *Yes, with documents / Not sure / No*

Q6. The last time a helper did not turn up or something went wrong, how did you find out? *Parent called / Neighbour or relative called / Helper told us / Found out later / Has not happened*

Q7. How long after it happened did you find out? *Under 30 min / 30 min–2 hours / 2–6 hours / Later the same day / Next day or later / Not applicable*

Q8. How long did it take to get a replacement? *Same day / 1–2 days / 3 or more days / Never got one / Not applicable*

Q9. Roughly how much does your family spend on home help or care for them each month? *Nothing, no paid help / Under ₹10,000 / ₹10,000–25,000 / ₹25,000–50,000 / Over ₹50,000 / Prefer not to say*

Q10. Rank what matters most to you in a home care service. *Verified caregiver / Proof of each visit / Alert if no-show / Backup within 4 hours / Lowest price*

Q11. Would you pay ₹1,500–3,000 a month, on top of care costs, for verification, visit proof, alerts and backup cover? *Yes / Maybe / No*

Q12. Would your parent be comfortable with a caregiver checking in with a photo and location at each visit? *Yes / Probably / No / Not sure*

Q13. What is your biggest worry about your parents' care while you are away? (optional) *Open text*

Key findings

- Paid help is common: 15 of 26 families have or had a paid helper at home (Q3), mostly found through relatives or neighbours (8 of 15, Q4). Only 7 of 15 had the helper's background checked with documents (Q5).
- Families learn of problems late: 9 of 14 who had a problem heard about it only when the parent or a neighbour called (Q6); 13 of 15 found out 30 minutes or more later, and 8 of 15 after 2 hours or more (Q7).
- Replacement is slow: 1 of 14 got a replacement the same day; 8 of 14 waited 3 days or more or never got one (Q8).
- Demand is positive but needs testing: 21 of 26 would pay ₹1,500–3,000 a month and 5 might (Q11); 23 of 26 think their parent would accept photo and location check-ins (Q12). "Verified caregiver" ranked first overall (Q10), but 10 of 26 kept the listed order, so the ranking is not conclusive.
- In their words (Q13): "Something happens to them and I am informed too late."
- Limits: a convenience sample of batchmates, not a random sample of Indian families; figures are counts, not population estimates.
